

The background is a dark blue gradient. It features several thin, vertical white lines of varying lengths scattered across the frame. Interspersed among these lines are small squares in three colors: teal, orange, and pink. Some squares are solid, while others are outlined. The overall aesthetic is modern and minimalist.

Problem Statement

Legal teams lack a systematic mechanism to identify which existing vendor contracts fall out of compliance when internal policies are updated. Approved contracts are not re-evaluated against new policy versions, creating an undetected compliance gap between current policy requirements and live contractual obligations.

Addressing Key Legal Operations Challenges

PAIN POINT	INDUSTRY STATISTIC	USER NEEDS	HOW WE ADDRESS THE NEED
No visibility into contracts affected by policy changes	71% of companies report their contracts are not monitored for deviations from standard terms. <i>(EY Law Survey, 2021)</i>	• Quickly identify contracts impacted by new policies • Improve compliance visibility • Reduce compliance risk	✓ Automatically re-evaluates all stored contracts after every policy update ✓ Identifies affected clauses using AI agent and RAG ✓ Generates Drift Reports for audit and compliance tracking
Manual contract review is slow and resource-intensive	Lawyers spend an average of 92 minutes reviewing a single contract manually. <i>(Bloomberg Law, 2024)</i>	• Reduce manual review time • Faster policy compliance checks • Faster legal turnaround	✓ Retrieves only relevant policy and contract clauses using RAG ✓ Performs automated clause-by-clause compliance checks ✓ Reduces the time required for policy re-evaluation
Limited legal resources to manage increasing workloads	98% of Singapore General Counsel reported insufficient in-house staffing for legal work. <i>(Axiom Singapore)</i>	• Increase productivity without hiring additional staff • Automate repetitive legal work • Scale legal operations efficiently	✓ AI agents automate first-pass compliance reviews ✓ Enables legal teams to handle more contracts without increasing headcount ✓ Frees lawyers to focus on high-risk legal decisions and strategic work

Existing Competitors & Gaps

IRONCLAD

Manages the contract lifecycle — doesn't benchmark new contracts against past vendor agreements.

ICERTIS-CLM

Strong governance, but not built to compare terms across your historical contract library.

DOCUSIGN CLM

Excellent document workflow — precedent benchmarking isn't a core capability.

LUMINANCE

Flags risky clauses, but reviews legally in isolation — not against your own signed precedent.

Real Gap: Every review happens in isolation. **None of them cross-reference an incoming contract against the terms** you've already agreed to elsewhere.

Solution

An AI-powered review platform that **automates clause extraction, policy compliance, and precedent comparison across every signed contract** — while **a human always approves the final call**.

Unlike fully autonomous automation, we pair AI efficiency with human judgment for faster, more consistent, trustworthy decisions.

Tech Stack

FRONTEND — React

Component-based UI for the review dashboard

BACKEND — Python FastAPI

Orchestration layer for extraction, comparison & workflow APIs

DATABASE — Supabase

Postgres-backed storage for contracts, policies & review history

LLM & AGENTS — ChatGPT / Claude

Model agents orchestrated on Microsoft Azure AI Foundry

DEPLOYMENT — Microsoft Azure

Vercel as backup deployment target

WorkFlow

AI-powered step

Final output

Platform Features

Contract & Policy Mgmt

- Upload contracts (PDF)
- Upload policy books
- Manage historical library

Version History

- Track policy revisions
- Track contract revisions
- Review timestamps

Workflow Tracking

- Review progress pipeline
- Per-agent processing status
- Pending / Completed states

Search & Filters

- Search contracts & findings
- Filter by clause / risk
- Filter by issue category

Business Scalability

1. Automatic Policy Re-evaluation: Eliminates manual contract reviews after policy updates
2. Incremental Rechecks: Contracts are processed once and stored, future policy updates re-use existing clause data, so re-checks get faster as the contract library grows
3. Multi-Team Policy Management: Allows Legal, Procurement, Compliance, and GRC teams within the same organization to maintain independent policies while sharing a centralized contract repository.
4. Higher Review Throughput: Teams can handle more policy and contract volume without increasing headcount.
